Stewards of the Environment™

2015 Water Quality Report

It's Time To Conserve. Water: It's Too Precious To Waste.

A Message from the Vice President

John Walsh
Vice President, Operations
Aquarion Water Company of MA

Dear Aquarion Customer:

Delivering safe drinking water to you is Aquarion's highest priority. That's why, in 2015, we conducted 8,111 tests on the water we supplied to our Massachusetts' customers. We're proud to publish the test findings in this report, again showing that our water continued to meet or surpass every quality standard set by state and federal agencies.

Aquarion also has a strong, ongoing commitment to investing in our infrastructure. The investments we make underscore our commitment to provide you with high-quality water and prompt, dependable service.

We value our ongoing, good working relationship with our customers and the towns we serve. We also enjoy supporting these communities and getting involved in local organizations and events through sponsorship and participation. Last year, we sponsored a girls' softball team, and we donated to the Millbury Police comedy night and Millbury Little League. We provided water for the Annual 4th of July Road Race and participated in the Adopt-A-Banner initiative to beautify Millbury center during the holidays. Aquarion staff not only volunteered to read at the Community Reading Day at Shaw School, but also planted flowers and maintained the grounds for a monument on Millbury Avenue.

In closing, I'd like to thank all our employees for their excellent work in providing you with safe, clean water and dependable service. From all of us at Aquarion, it is a pleasure serving you and all our customers in Millbury.

Please feel free to share with us your questions about water-related issues in town. Our customer service line is **1-800-732-9678**, or you may contact Ronit Goldstein at rgoldstein@aquarionwater.com.

Sincerely,

John Walsh
Vice President, Operations
Aquarion Water Company of MA

Facts and Figures

Aquarion conducts an extensive quality testing program each year to ensure its 56,000 customers in Massachusetts have safe, clean drinking water. In 2015, we collected 1,697 samples, on which we conducted 8,111 quality tests. These tests are designed to detect and measure the presence of more than 100 compounds, many of which occur through erosion of natural deposits. Constant testing enables us to confirm that the water we supply meets or exceeds state and federal standards.

The results reported in the table on the next page demonstrate the effectiveness of our ongoing efforts to protect the purity of Aquarion water every step of the way from the source to your tap.

Water Quality Table for Customers in the Millbury System

Your water has been tested for more than 100 compounds that are important to public health. Only 14 of these were detected, all of which were below the amounts allowed by state and federal law. Most of these

compounds are either naturally occurring or introduced as treatment to improve water quality. Monitoring frequency varies from daily to once every nine years per EPA regulation, depending on the parameter.

Our testing encompasses the full range of regulated inorganic, organic and radiological compounds and microbiological and physical parameters. Results shown below are for detected compounds only.

Substance (Units of Measure)	Highest Allowed by Law		Compliance	Test Date	Millbury System Detected Level	
	MCLG	MCL			Average	Range
Inorganic Compounds						
Barium (ppm)	2	2	YES	2015	0.083	0.056 – 0.098
Copper (ppm)	1.3	AL = 1.3	YES	2013	0.50*	
Lead (ppb)	0	AL = 15	YES	2013	2**	
Nitrate (ppm)	10	10	YES	2015	1.60	1.60 – 1.70
Perchlorate (ppb)	NA	2	YES	2015	0.21	0.08 – 0.30
Microbials						
Turbidity (NTU)	NA	TT = 1 max	YES	2015	0.07+	0.06 – 0.07
Turbidity (NTU)	NA	TT = 95% of samples < 0.3	YES	2015		100%
Disinfectant						
Chlorine (ppm)	MRDLG 4	MRDL 4	YES	2015	0.80	0.47 – 1.45
Organic Compounds						
Total Trihalomethanes (ppb)	NA	80	YES	2015	37***	5 – 46
Total Haloacetic Acids (ppb)	NA	60	YES	2015	12***	ND < 1 – 16
Radiologicals						
Radium 226 & 228 (pCi/L)	0	5	YES	2015	ND < 0.8	ND < 0.8 – 1.4
Inorganic Compounds						
Chloride (ppm)	NA	SMCL = 250	NA	2015	334	260 – 360
Manganese (ppb)	NA	SMCL = 50	NA	2015	40.0	ND < 2 – 150
Sodium (ppm)	NA	ORSG = 20	NA	2015	180	93 – 220
Sulfate (ppm)	NA	SMCL = 250	NA	2015	23.1	18.0 – 25.0

Footnotes and Definitions for table on left

- < Less than
- AL Action Level: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.
- MCL Maximum Contaminant Level: The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
- MCLG Maximum Contaminant Level Goal: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.
- MRDL Maximum Residual Disinfectant Level: The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
- MRDLG Maximum Residual Disinfectant Level Goal: The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contamination.
- NA Not Applicable
- ND Not Detected
- NTU Nephelometric Turbidity Units, a measure of the presence of particles. Low turbidity is an indicator of high-quality water.
- ORSG Office of Research and Standards Guideline - State of Massachusetts
- pCi/L Picocuries per liter
- ppb parts per billion, or micrograms per liter (ug/L)
- ppm parts per million, or milligrams per liter (mg/L)
- SMCL Secondary Maximum Contaminant Level
- TT Treatment Technique: A required process intended to reduce the level of a contaminant in drinking water.
- * 90th percentile value in copper monitoring. Result is representative of customer sampling stagnant water. No locations exceeded the action level for copper.
- ** 90th percentile value in lead monitoring. Result is representative of customer sampling stagnant water. No locations exceeded the action level for lead.
- *** Reported value is the highest locational, annual average of quarterly measurements for disinfection by-products in the distribution system. Values in the range are individual measurements.
- + Reported value is the highest monthly average for turbidity from the Millbury Avenue treatment plant effluent. Values in the range are individual measurements. Turbidity is a measure of the water's cloudiness. We monitor it because it is a good indicator of water quality.

HEALTH EFFECTS
Manganese: Manganese is a naturally occurring mineral found in rocks, soil, ground water, and surface water. Manganese is necessary for proper nutrition and is part of a healthy diet, but it can have undesirable effects on certain sensitive populations at elevated concentrations. Drinking water may have manganese naturally and, when concentrations are greater than 50 ug/L (ppb), the water may be discolored and taste bad. Over a lifetime, the EPA recommends that people drink water with manganese levels less than 300 ug/L and, over the short term, it recommends that people limit their consumption of water with levels over 1,000 ug/L, primarily due to concerns about possible neurological effects. Children up to 1 year of age should not be given water with manganese concentrations over 300 ug/L, nor should formula for infants be made with that water for longer than 10 days.

Sodium: Sodium-sensitive individuals such as those experiencing hypertension, kidney failure, or congestive heart failure, who drink water containing sodium should be aware of levels where exposures are being carefully controlled.

Your Health Is Our Priority

The Millbury System PWS ID#: MA2186000

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not

necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe

Drinking Water Hotline **(800-426-4791)**.

Here is some additional information of interest about Aquarion's drinking water.

Where does your water come from?

The water provided to Millbury customers is collected in four wells, treated, and delivered to homes and businesses through an extensive underground piping system. This system, located in the Blackstone River Watershed, serves approximately 8,200 people. The average amount of water delivered during 2015 was 1.5 million gallons per day.

At high-demand periods in 2015, water from Worcester supplemented the supply, accounting for 1% of the total use. The distribution system also is interconnected to Grafton's water supply for emergencies or periods of high water use.

How is your water treated?

All water from the four wells is filtered naturally underground and then receives chemical treatment for disinfection and pH adjustment. The water from the Millbury Avenue Well also is filtered at the Millbury Avenue Water Treatment Facility to provide additional protection from microbes. Water from the two Jacques wells receives additional treatment through an ion exchange system to remove perchlorate from the water.

Cryptosporidium

The EPA requires public water systems that use surface water sources to monitor for Cryptosporidium. This is a microbial pathogen found in lakes and rivers throughout the U.S. that can cause gastrointestinal illness if consumed. Aquarion continues to monitor its surface water sources and has not detected Cryptosporidium.

Disinfection By-Products

Disinfection by-products (DBPs) are chemicals formed during the disinfection process, when naturally occurring organic matter reacts with chlorine, which is added to water to eliminate bacteria and other microorganisms. Currently there are limits on two types of DBPs known as Total Trihalomethanes (TTHM) and Total Haloacetic Acids (THAA). Some people who drink water containing DBPs that exceed these limits over many years may experience problems with their livers, kidneys, or central nervous systems, and may have an increased risk of getting cancer.

The state has implemented new DBP regulations that change how compliance with the standards is determined. The intent is to increase protection against the potential health risks associated with DBPs. Aquarion Water Company continues to evaluate its systems to ensure compliance with DBP regulations.

Source Water Assessment Report

The Massachusetts Department of Environment Protection's (DEP) Source Water Assessment Program, which evaluates each water source to identify potential contamination, states that the water sources that supply drinking water to the Millbury System have a high susceptibility to potential contamination. The report is available on the DEP website: mass.gov/dep/water/drinking/2186000.pdf.

Understanding Your Water Quality Table

Barium:	Erosion of natural deposits.
Copper:	Corrosion of household plumbing systems.
Lead:	Corrosion of household plumbing systems.
Nitrate:	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits.
Perchlorate:	Rocket propellants, fireworks, munitions, flares, and blasting agents; breakdown product of disinfection additive.
Turbidity:	Sediment particles; naturally occurring iron and manganese; soil runoff.
Chlorine:	Water additive used to control microbes.
Total Trihalomethanes:	By-product of drinking water chlorination.
Total Haloacetic Acids:	By-product of drinking water chlorination.
Radium 226 & 228:	Erosion of natural deposits.
Chloride:	Naturally present in the environment.
Manganese:	Erosion of natural deposits.
Sodium:	Water treatment processes; use of road salt; naturally present in the environment.
Sulfate:	Naturally present in the environment.

Your Health Is Our Priority

Copper and Lead

Copper is an essential nutrient, but some people who drink water containing copper in excess of the action level* over a relatively short period of time could experience gastrointestinal distress. Some people who drink water containing copper in excess of the action level over many years could suffer liver or kidney damage. People with Wilson's Disease should consult their personal doctor. Major sources of copper in drinking water include corrosion of household plumbing systems and erosion of natural deposits.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water comes primarily from materials and components associated with service lines and home plumbing. Aquarion Water Company is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. Fortunately, the Lead in Drinking Water Act, which took effect in January 2014, requires a significant reduction of the lead content in new plumbing components that contact drinking water. As a result, the lead content in new pipes, fittings, fixtures and solder must be reduced from 8% to 0.25%.

Customers can minimize the potential for lead exposure when water has been sitting for several hours by running the tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at epa.gov/safewater/lead.

*The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Immuno-compromised persons

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

More Information You Should Know

Protecting your water at home

Cross-Connection Control Program

Our Cross-Connection Control Program helps ensure that your drinking water is protected from possible contamination. A cross-connection, as defined by the Massachusetts Department of Environmental Protection (DEP), "is any actual or potential connection between a distribution pipe of potable water from a public water system and any waste pipe, sewer, drain, or other unapproved source that has the potential, through back-pressure or back-siphonage, to create a health hazard to the public water supply and the water system within the premises."

Aquarion's DEP-certified, cross-connection surveyors and testers routinely conduct surveys and test backflow prevention devices at our customers' facilities for regulatory compliance. If they find unprotected cross-connections, they will require installation of backflow prevention devices to protect the water distribution system.

The best protection against cross-connection contamination is to eliminate the link. Garden hoses are a leading cause of cross-connection contamination. At your home, you can protect your family and the distribution system from potential contaminants by installing a simple, inexpensive backflow device called a Hose-Bibb Vacuum Breaker (HBVB) that mounts directly to your spigot.

Protecting water at the source

Even small quantities of pollutants may be enough to contaminate a drinking water supply. Examples of pollutants that may wash into surface water or seep into ground water include:

- ◆ Microbial contaminants from septic systems, agriculture and livestock operations, and wildlife;

- ◆ Inorganic contaminants such as salts and metals that can be naturally occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, or farming;
- ◆ Pesticides and herbicides from sources such as agriculture, urban storm water runoff, and residential uses;
- ◆ Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes; and
- ◆ Radioactive contaminants that can be naturally occurring.

You can help prevent water contamination

- ◆ Ensure that your septic system is working correctly.
- ◆ Use chemicals and pesticides wisely.
- ◆ Dispose of waste chemicals and used motor oil properly.
- ◆ Report illegal dumping, chemical spills, or other polluting activities to the MA DEP's Emergency Response Section at (888-304-1133), Aquarion Water (781-740-6690), or your local police.

Water conservation in your home

Our water supply is sufficient to meet your needs, but we still encourage you to conserve this precious natural resource for the good of our environment.

There are plenty of simple steps you can take to reduce your water consumption: fix faucet and toilet leaks; turn off the water while shaving or brushing your teeth; run full loads in your dishwasher and clothes washer; water your lawn in early morning; and use a broom to clean debris from your driveway instead of a hose.

Your 2015 Water Quality Report

Customers who have questions about water quality should call us at **800-832-2373**, send an email to waterquality@aquarionwater.com; or visit aquarionwater.com.

Water: More Ways To Save It

Though this report focuses on the quality of the water Aquarion provides you, quantity is vitally important, too.

You and more than 700,000 other people depend on us to provide enough water to supply your daily needs. As rainfall patterns appear to be changing, it's time for all of us to be even more careful about the way we use water. Here are some tips on reducing waste that you may not have considered:

Use water-efficient

appliances. Older washing machines and dishwashers consume large quantities of water. New ones work more efficiently, using just a fraction of what the earlier models need.

Save with every flush.

New model toilets can save three or more gallons every time you flush, and they do the job just as well as the old-fashioned ones.

Turn off the taps. Whether you're brushing your teeth or getting a glass of water, try to keep

good, clean water from going down the drain. Turn off the faucet while tending to your teeth. And keep a jug of water in the refrigerator so a cold glass is instantly available, rather than running the tap until the water is cold.

Shorten shower times.

You'll not only use less water; you'll reduce your water-heating costs as well.

Water grass, not pavement.

Carefully aim sprinklers and irrigation heads so they're not wetting driveways, sidewalks and patios. Water either in early morning or early evening – and, of course, only when your lawn is actually starting to wilt.

For most people, conserving water is already second nature. Adding a few more techniques can reduce waste even more – and lower your water bill, too. For many more ways to ensure a healthy supply for decades to come, check out aquarionwater.com/conserve.

Visit Mystic Aquarium's Beluga Whales Live!

Aquarion is the sponsor of three cameras trained on the exciting Beluga whale exhibit at Mystic Aquarium in Connecticut, the only one of its kind in New England. Go to aquarionwater.com and click on the cameras at any time during daylight hours to watch the Aquarium's three belugas – Kela, Naku and Natuark – in the 750,000-gallon, arctic marine environment created just for them.
